UI/UX CASE STUDY · iOS APP

Concept · Interactive prototype

Skylift

An emergency drone-dispatch app designed for the moment people need help most: calm, one-tap, and readable under stress.

ROLE	TIMELINE	TOOL	PLATFORM
UI/UX Designer	42 hours	Figma Make	iOS (iPhone)

01 Overview

The problem

Asking for medical help is stressful. If the key action is buried in menus or the status is unclear, users lose time when every second counts.

The goal

Make requesting aerial help a single tap, keep dispatch status always visible, and get critical medical info to responders fast.

My role

End-to-end design: user flows, information architecture, visual and interaction design, accessibility QA, and the interactive prototype in Figma Make.

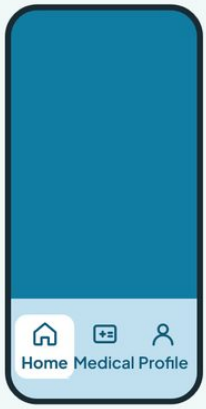

02 Key design decisions

HOME

One big, centered help button

People in an emergency may be scared, distracted or using one hand. The help CTA is the largest target on Home and sits dead-center, so there is nothing to hunt for. During dispatch it shows the live ETA.

NAVIGATION

Three tabs, always starting on Home

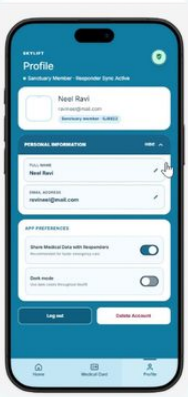

Just Home, Medical Card and Profile. No hamburger menu, no hidden screens. The app opens on Home, and Home stays active while you switch tabs, so the dispatch timer never resets.

MEDICAL CARD

Built for emergency responders

Emergency contacts are one-tap call buttons. Blood type, allergies, medications and conditions sit in a two-column clinical grid, with a separate Digital Pass entry for a scannable ID.

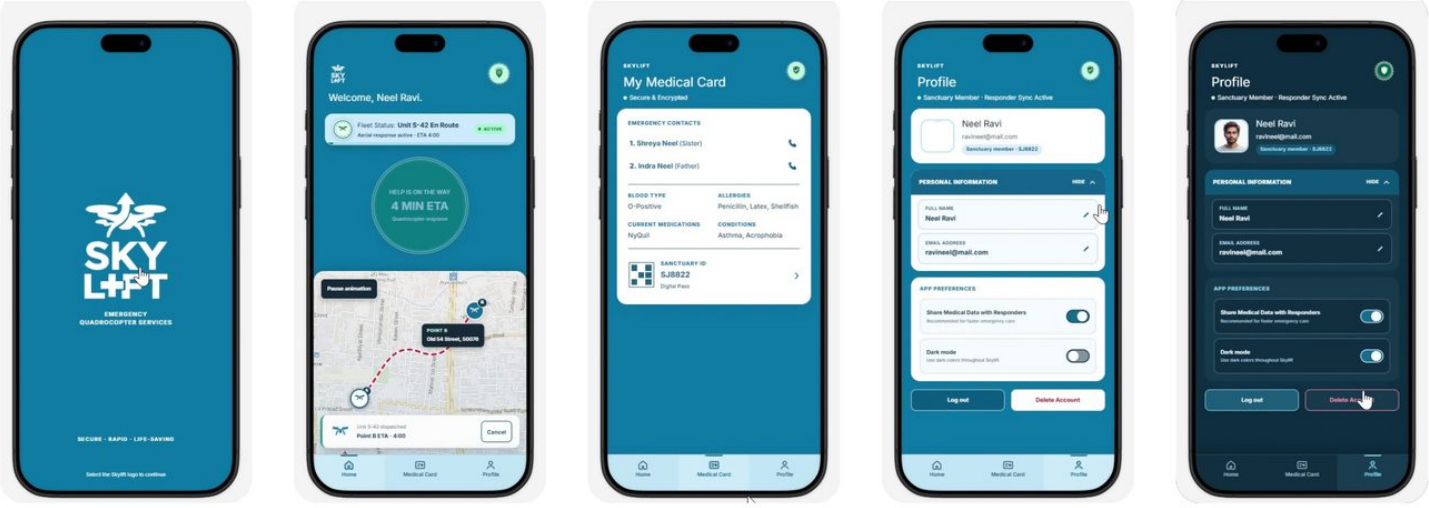

PROFILE

Simple, personal control

Users edit their name and email (reflected in the Home greeting), choose whether to share medical data with responders, and turn on dark mode. Log out and Delete Account sit apart at the bottom.

03 User flow, in five screens

1 · Splash
Branded entry, one tap to continue

2 · Home
Status, ETA, live route and cancel

3 · Medical Card
Contacts and clinical info for responders

4 · Profile
Edit details, sharing and theme

5 · Dark mode
Same layout, deep-teal surfaces

04 Visual system

Teal-led and calm, not alarm-red. Light cards make medical data easy to scan; mint is reserved for active status.

Brand teal #117CA1	**Deep teal** #105878	**Ice blue** #C0E0F0	**Pale card** #F0F8F8
Dark base #0F2E3D	**Dark surface** #123B4A	**Cyan accent** #8EDCF0	**Status mint** #B9F2D8

05 Accessibility (WCAG AA)

36/36 Color-contrast pairs passing in light and dark themes

44 px Minimum touch targets (44×44) for every control

Motion Pause/play on the route animation, plus reduced-motion support

Live Screen-reader announcements when dispatch status changes

Fit Home fits one iPhone screen, clear of the Dynamic Island and home indicator

06 Process: 42 hours

Bar width = hours spent

Research & IA	Visual design	Dispatch & live route	Medical & profile	Layout & device fit	Accessibility QA
6h	7.5h	9.5h	6.5h	7.5h	5h

07 Outcome & next steps

What this project shows

- **Product thinking:** one journey, one clear primary action
- **Interaction design:** live route, ETA, pause and cancel
- **Systems thinking:** state kept across tabs, light/dark parity

What I'd validate next

- Usability tests with realistic emergency scenarios
- Failure states: no GPS, lost signal, no drone free, failed dispatch
- Clear status steps: submitted → assigned → airborne → arrived
- Review with clinical, aviation and privacy experts
